Quantum matter with quasiparticles:

A quasiparticle is an “excited lump” in the many-electron state which responds just like an ordinary particle.

Quantum matter with quasiparticles:

Metals

Quantum matter with quasiparticles:

Metals

Quantum matter with quasiparticles:

The quasiparticle idea is the key reason for the many successes of quantum condensed matter physics:

- Fermi liquid theory of metals, insulators, semiconductors
- Theory of superconductivity (pairing of quasiparticles)
- Theory of disordered metals and insulators (diffusion and localization of quasiparticles)
- Theory of metals in one dimension (collective modes as quasiparticles)
- Theory of the fractional quantum Hall effect (quasiparticles which are 'fractions' of an electron)

Quantum matter without quasiparticles

Strange metal

Entangled electrons lead to “strange” temperature dependence of resistivity and other properties

Figure: K. Fujita and J. C. Seamus Davis

“Strange”,

“Bad”,

or “Incoherent”,

metal has a resistivity, ρ , which obeys

$$\rho \sim T,$$

and

$$\rho \gg h/e^2$$

(in two dimensions),
where h/e^2 is the quantum unit of resistance.

Quantum matter with quasiparticles:

- **Quasiparticles are additive excitations:**
The low-lying excitations of the many-body system can be identified as a set $\{n_\alpha\}$ of quasiparticles with energy ε_α

$$E = \sum_{\alpha} n_{\alpha} \varepsilon_{\alpha} + \sum_{\alpha, \beta} F_{\alpha\beta} n_{\alpha} n_{\beta} + \dots$$

In a lattice system of N sites, this parameterizes the energy of $\sim e^{\alpha N}$ states in terms of poly(N) numbers.

Quantum matter with quasiparticles:

- Quasiparticles eventually collide with each other. Such collisions eventually leads to thermal equilibration in a chaotic quantum state, but the equilibration takes a long time. In a Fermi liquid, this time diverges as

$$\tau_{\text{eq}} \sim \frac{\hbar E_F}{(k_B T)^2} \quad , \quad \text{as } T \rightarrow 0,$$

where E_F is the Fermi energy.

The SYK model

- Low energy, many-body density of states

$$\rho(E) \sim e^{Ns_0} \sinh(\sqrt{2(E - E_0)N\gamma})$$

- Low temperature entropy $S = Ns_0 + N\gamma T + \dots$

A. Kitaev, unpublished
J. Maldacena and D. Stanford, 1604.07818

The SYK model

- Low energy, many-body density of states
 $\rho(E) \sim e^{Ns_0} \sinh(\sqrt{2(E - E_0)N\gamma})$
- Low temperature entropy $S = Ns_0 + N\gamma T + \dots$
- $T = 0$ fermion Green's function is incoherent: $G(\tau) \sim \tau^{-1/2}$ at large τ . (Fermi liquids with quasiparticles have the coherent: $G(\tau) \sim 1/\tau$)
S. Sachdev and J. Ye, PRL **70**, 3339 (1993)

The SYK model

- Low energy, many-body density of states
 $\rho(E) \sim e^{Ns_0} \sinh(\sqrt{2(E - E_0)N\gamma})$
- Low temperature entropy $S = Ns_0 + N\gamma T + \dots$
- $T = 0$ fermion Green's function is incoherent: $G(\tau) \sim \tau^{-1/2}$ at large τ . (Fermi liquids with quasiparticles have the coherent: $G(\tau) \sim 1/\tau$)
- $T > 0$ Green's function has conformal invariance
 $G \sim (T / \sin(\pi k_B T \tau / \hbar))^{1/2}$

A. Georges and O. Parcollet PRB **59**, 5341 (1999)

The SYK model

- Low energy, many-body density of states
 $\rho(E) \sim e^{Ns_0} \sinh(\sqrt{2(E - E_0)N\gamma})$
- Low temperature entropy $S = Ns_0 + N\gamma T + \dots$
- $T = 0$ fermion Green's function is incoherent: $G(\tau) \sim \tau^{-1/2}$ at large τ . (Fermi liquids with quasiparticles have the coherent: $G(\tau) \sim 1/\tau$)
- $T > 0$ Green's function has conformal invariance
 $G \sim (T / \sin(\pi k_B T \tau / \hbar))^{1/2}$
- The last property indicates $\tau_{\text{eq}} \sim \hbar / (k_B T)$, and this has been found in a recent numerical study.

Quantum matter without quasiparticles:

- If there are no quasiparticles, then

$$E \neq \sum_{\alpha} n_{\alpha} \varepsilon_{\alpha} + \sum_{\alpha, \beta} F_{\alpha\beta} n_{\alpha} n_{\beta} + \dots$$

Quantum matter without quasiparticles:

- If there are no quasiparticles, then

$$E \neq \sum_{\alpha} n_{\alpha} \varepsilon_{\alpha} + \sum_{\alpha, \beta} F_{\alpha\beta} n_{\alpha} n_{\beta} + \dots$$

- If there are no quasiparticles, then

$$\tau_{\text{eq}} = \# \frac{\hbar}{k_B T}$$

Quantum matter without quasiparticles:

- If there are no quasiparticles, then

$$E \neq \sum_{\alpha} n_{\alpha} \varepsilon_{\alpha} + \sum_{\alpha, \beta} F_{\alpha\beta} n_{\alpha} n_{\beta} + \dots$$

- If there are no quasiparticles, then

$$\tau_{\text{eq}} = \# \frac{\hbar}{k_B T}$$

- Systems without quasiparticles are the fastest possible in reaching local equilibrium, and all many-body quantum systems obey, as $T \rightarrow 0$

$$\tau_{\text{eq}} > C \frac{\hbar}{k_B T}.$$

S. Sachdev,
Quantum Phase Transitions,
Cambridge (1999)

- In Fermi liquids $\tau_{\text{eq}} \sim 1/T^2$, and so the bound is obeyed as $T \rightarrow 0$.
- This bound rules out quantum systems with *e.g.* $\tau_{\text{eq}} \sim \hbar/(Jk_B T)^{1/2}$.
- There is no bound in classical mechanics ($\hbar \rightarrow 0$). By cranking up frequencies, we can attain equilibrium as quickly as we desire.

Black holes

- Black holes have an entropy and a temperature, T_H .
- The entropy is proportional to their surface area.

LIGO
September 14, 2015

- The Hawking temperature, T_H influences the radiation from the black hole at the very last stages of the ring-down (not observed so far). The ring-down (approach to thermal equilibrium) happens very rapidly in a time $\sim \frac{\hbar}{k_B T_H} = \frac{8\pi GM}{c^3} \sim 8$ milliseconds.

Black holes

- Black holes have an entropy and a temperature, T_H .
- The entropy is proportional to their surface area.

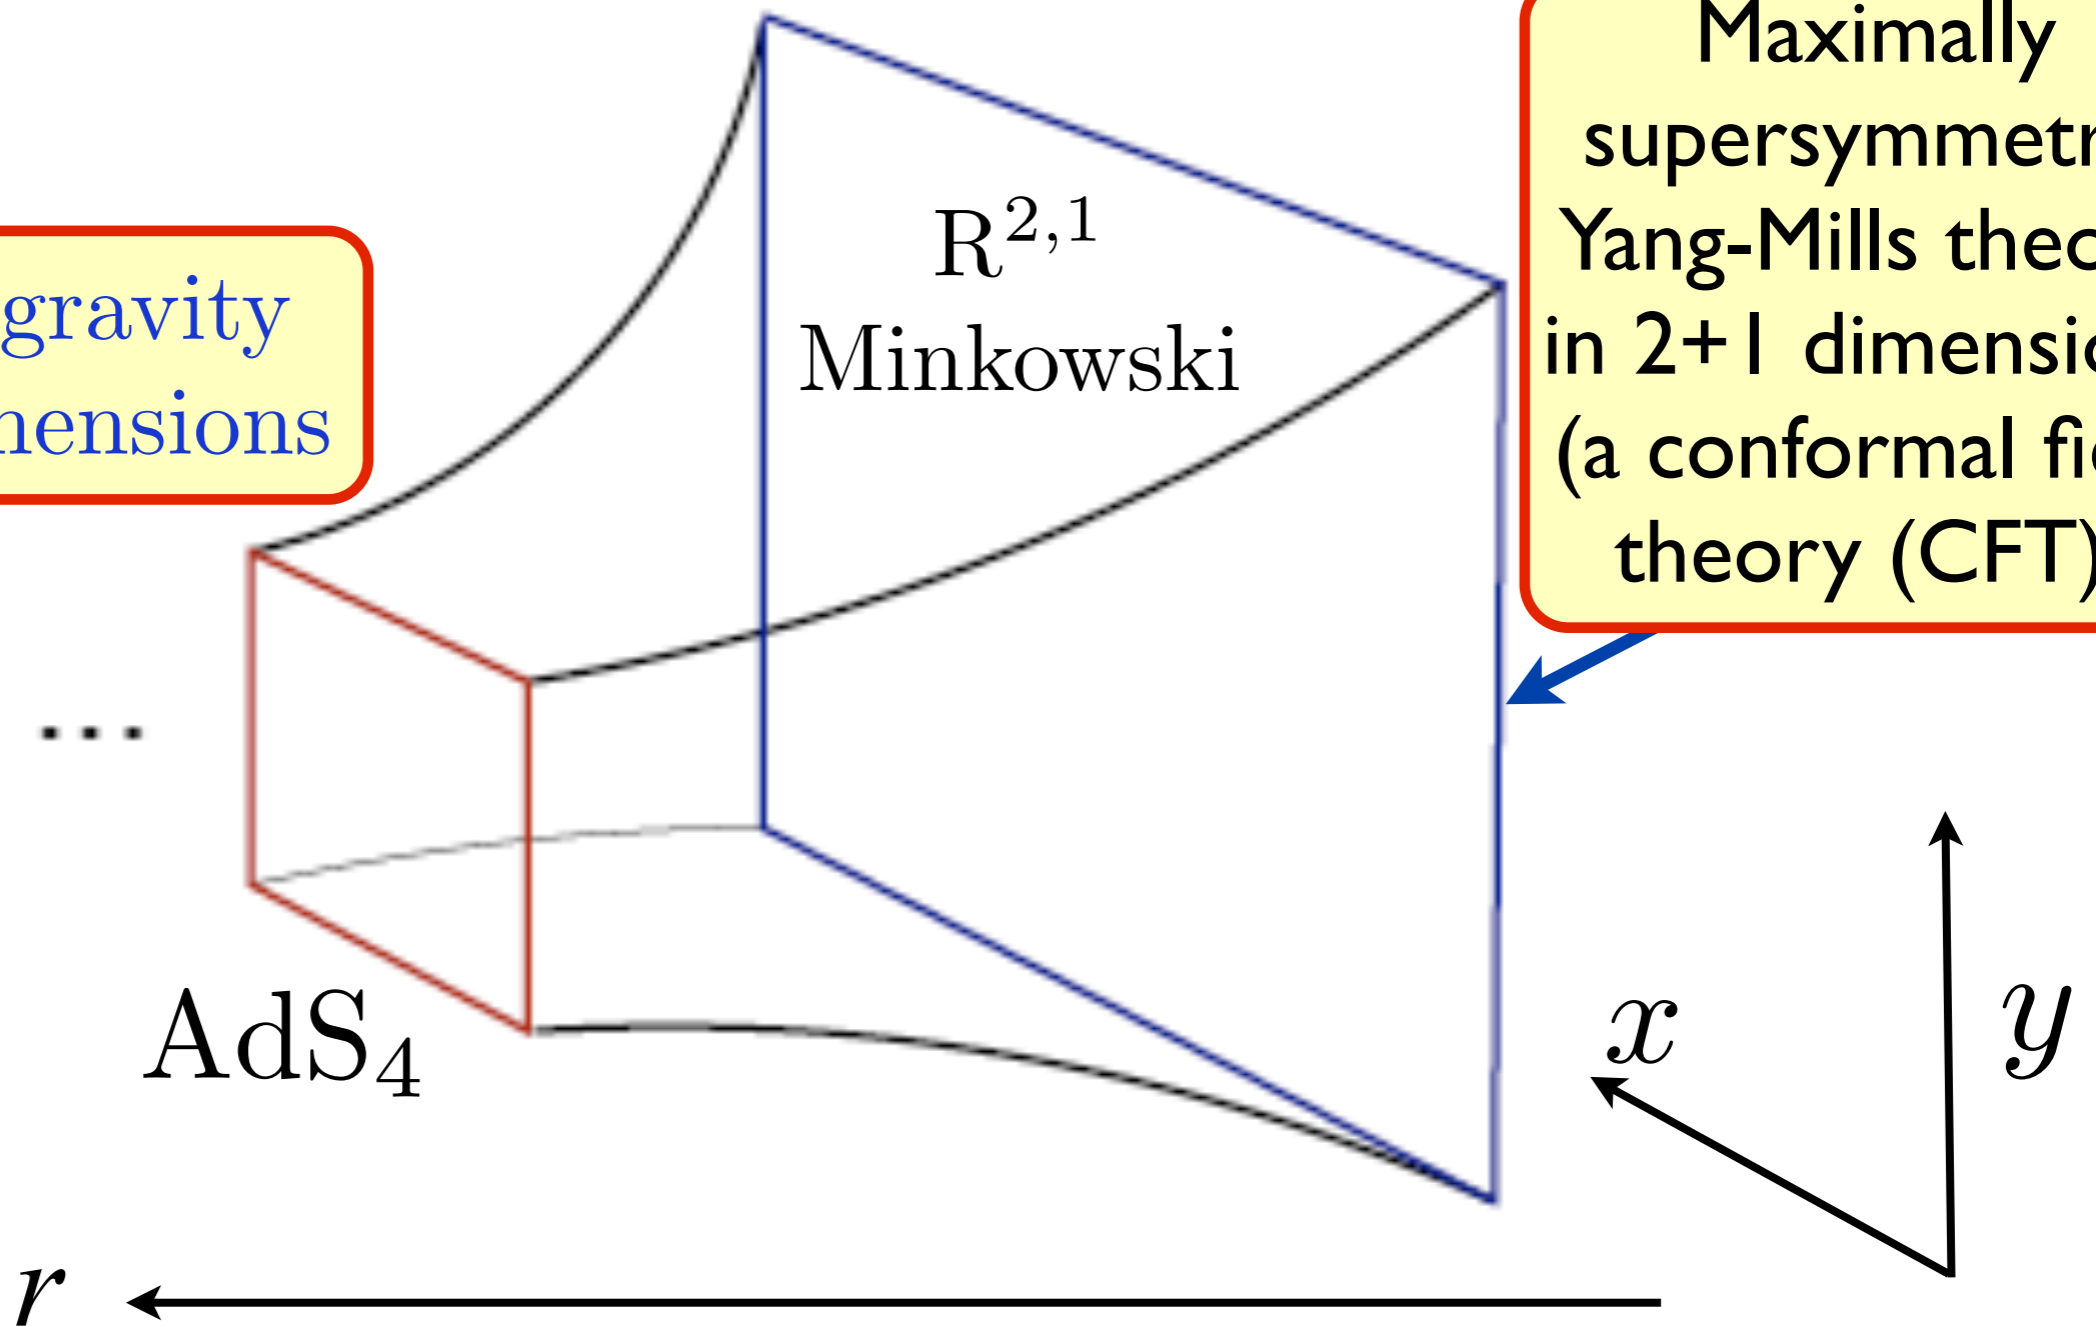

Black holes

- Black holes have an entropy and a temperature, T_H .
- The entropy is proportional to their surface area.
- They relax to thermal equilibrium in a time $\sim \hbar / (k_B T_H)$.

with $f(r) = 1 - (r/R)^3$

AdS/CFT correspondence at non-zero temperatures

AdS₄-Schwarzschild black-brane

Maximally supersymmetric Yang-Mills at a temperature $k_B T = \frac{3\hbar}{4\pi R}$.

Black hole entropy = Entropy of Yang-Mills theory

$$ds^2 = \left(\frac{L}{r}\right)^2 \left[\frac{dr^2}{f(r)} - f(r)dt^2 + dx^2 + dy^2 \right]$$

with $f(r) = 1 - (r/R)^3$

SYK and black holes

Is there a holographic quantum gravity dual of the SYK model ?

The SYK model

- Low energy, many-body density of states
 $\rho(E) \sim e^{Ns_0} \sinh(\sqrt{2(E - E_0)N\gamma})$
- Low temperature entropy $S = Ns_0 + N\gamma T + \dots$
- $T = 0$ fermion Green's function $G(\tau) \sim \tau^{-1/2}$ at large τ . (Fermi liquids with quasiparticles have $G(\tau) \sim 1/\tau$)
- $T > 0$ Green's function has conformal invariance
 $G \sim (T / \sin(\pi k_B T \tau / \hbar))^{1/2}$
- The last property indicates $\tau_{\text{eq}} \sim \hbar / (k_B T)$, and this has been found in a recent numerical study.

The SYK model

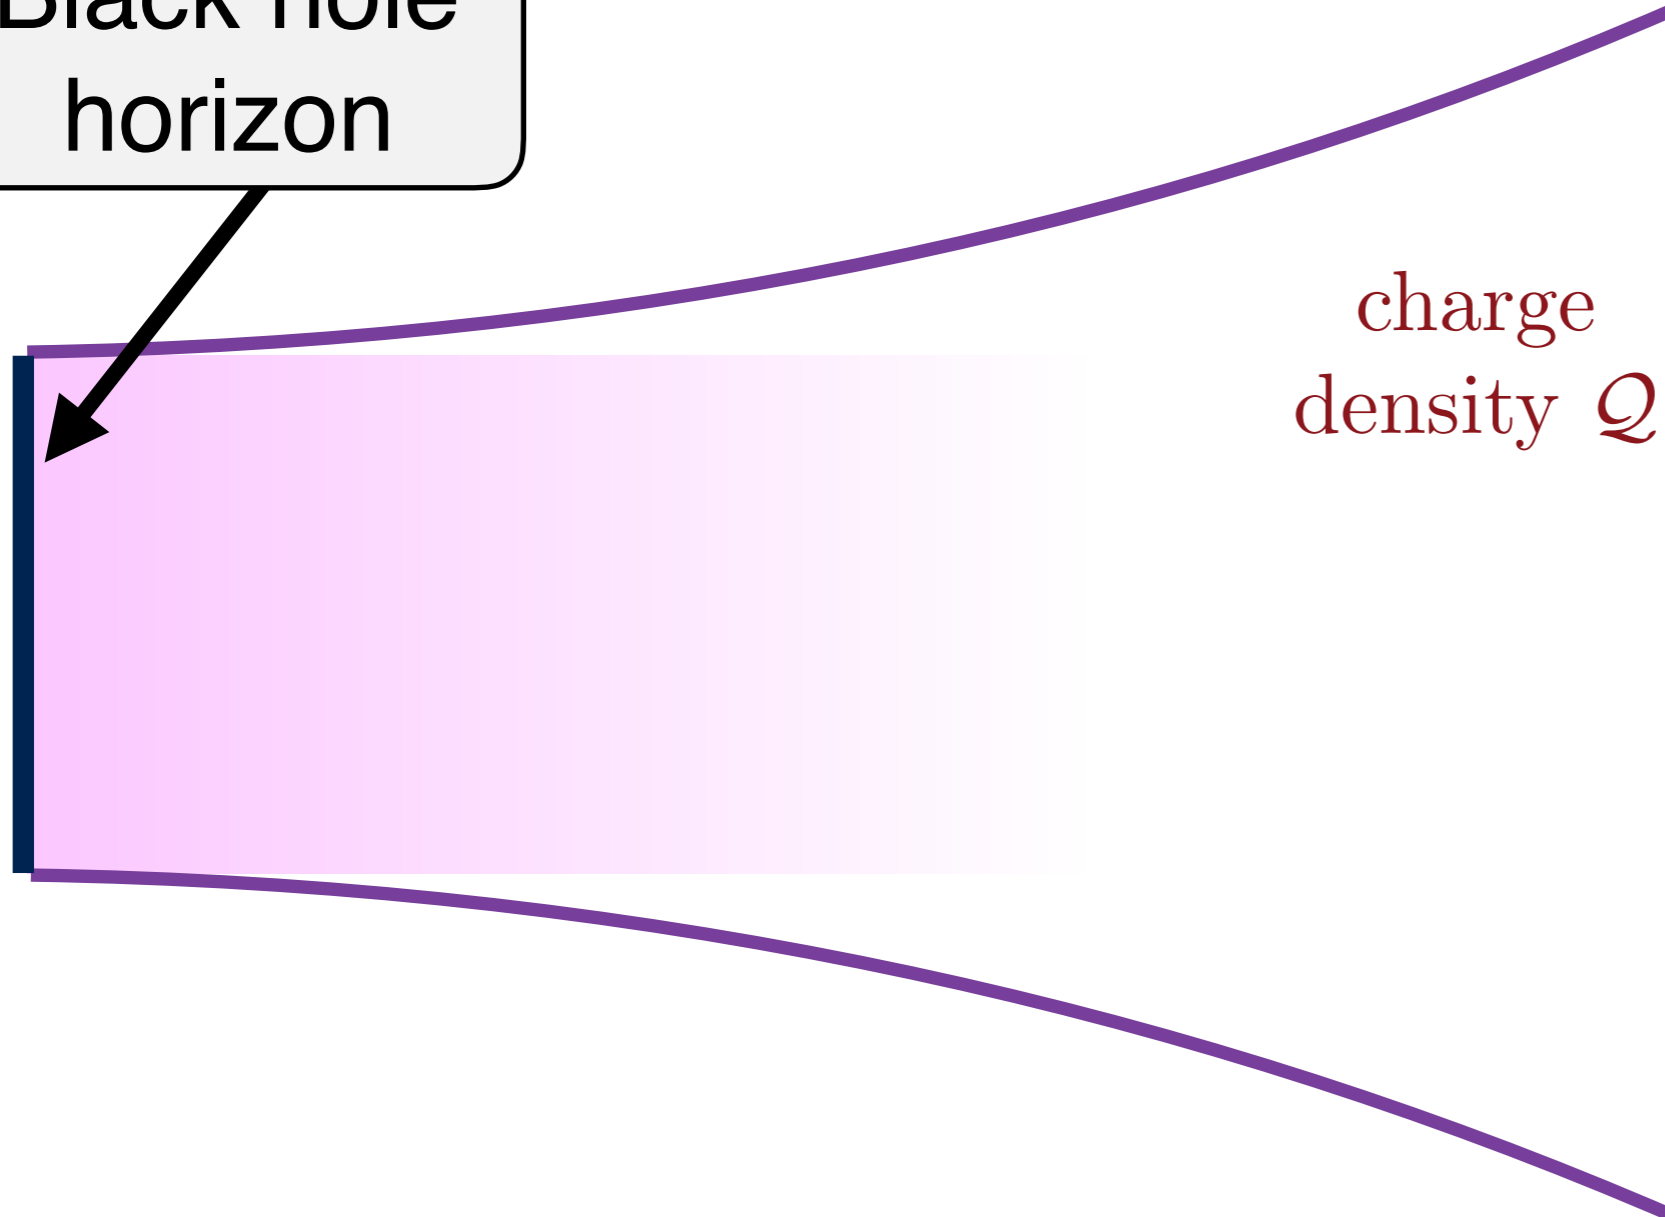

- Low energy, many-body density of states
 $\rho(E) \sim e^{Ns_0}$
- Low temperature entropy $S = Ns_0$
- $T = 0$ fermion Green's function $G(\tau) \sim \tau^{-1/2}$ at large τ . (Fermi liquids with quasiparticles have $G(\tau) \sim 1/\tau$)
- $T > 0$ Green's function has conformal invariance
 $G \sim (T / \sin(\pi k_B T \tau / \hbar))^{1/2}$
- The last property indicates $\tau_{\text{eq}} \sim \hbar / (k_B T)$, and this has been found in a recent numerical study.

SYK and black holes

- Low energy, many-body density of states
 $\rho(E) \sim e^{Ns_0}$
- Low temperature entropy $S = Ns_0$
- $T = 0$ fermion Green's function $G(\tau) \sim \tau^{-1/2}$ at large τ . (Fermi liquids with quasiparticles have $G(\tau) \sim 1/\tau$)
- $T > 0$ Green's function has conformal invariance
 $G \sim (T / \sin(\pi k_B T \tau / \hbar))^{1/2}$
- The **Is there any black hole which holographically matches these properties ?**

SYK and black holes

Black hole horizon

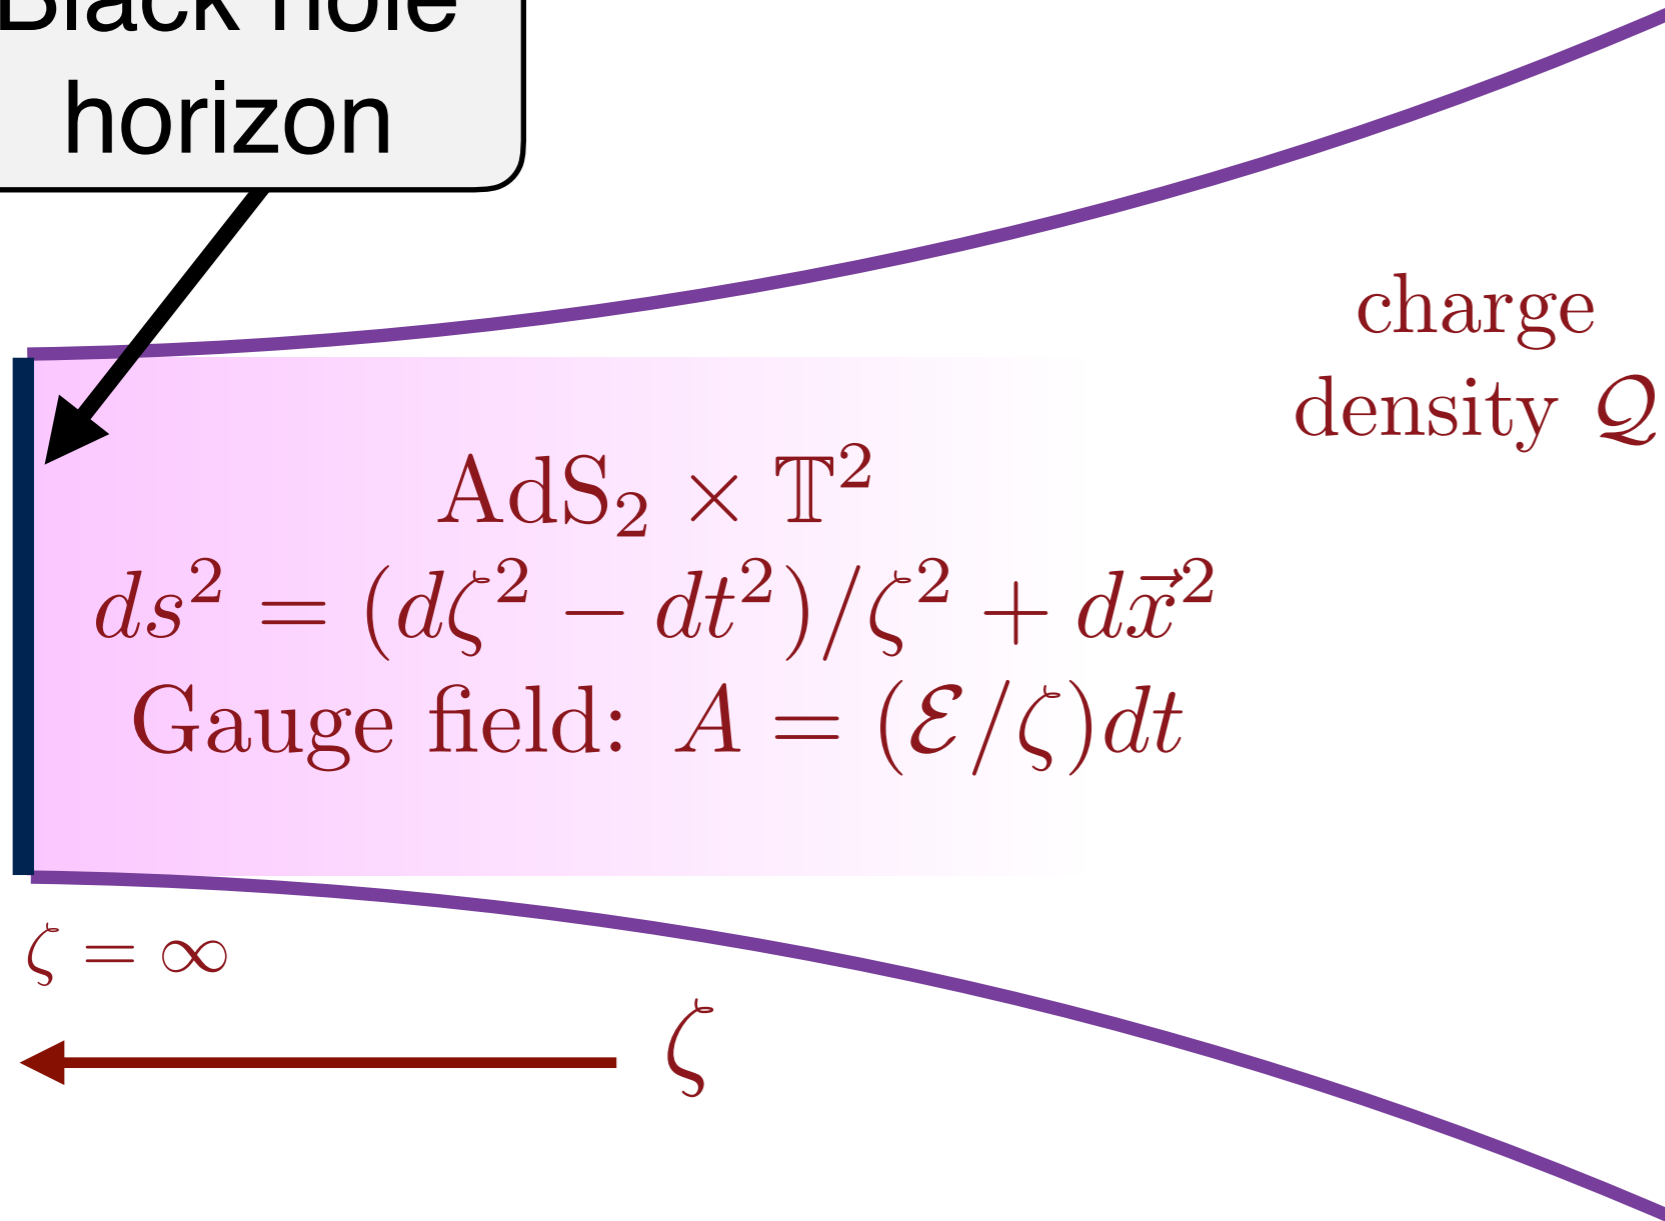

$$S = \int d^4x \sqrt{-\hat{g}} \left(\hat{\mathcal{R}} + 6/L^2 - \frac{1}{4} \hat{F}_{\mu\nu} \hat{F}^{\mu\nu} \right)$$

Yes, a charged black hole in
Einstein-Maxwell theory

SYK and black holes

Black hole horizon

The leading low temperature properties of an AdS-Reissner-Nordstrom black hole (as computed by T. Faulkner, H. Liu, J. McGreevy, and D. Vegh, arXiv:0907.2694) match those of the SYK model.

The mapping applies when temperature $\ll 1/(\text{size of } \mathbb{T}^2)$.

SYK and black holes

Black hole horizon

Quantum gravity on the $1+1$ dimensional spacetime AdS_2 (when embedded in AdS_4) is holographically matched to the $0+1$ dimensional SYK model

SYK and black holes

- Low energy, many-body density of states
 $\rho(E) \sim e^{Ns_0}$
- Low temperature entropy $S = Ns_0$
- $T = 0$ fermion Green's function $G(\tau) \sim \tau^{-1/2}$ at large τ . (Fermi liquids with quasiparticles have $G(\tau) \sim 1/\tau$)
- $T > 0$ Green's function has conformal invariance

All these properties of the SYK model match those of the AdS₂ horizon in Einstein-Maxwell theory

SYK and black holes

- Low energy, many-body density of states
 $\rho(E) \sim e^{Ns_0} \sinh(\sqrt{2(E - E_0)N\gamma})$
- Low temperature entropy $S = Ns_0 + N\gamma T + \dots$
- $T = 0$ fermion Green's function $G(\tau) \sim \tau^{-1/2}$ at large τ . (Fermi liquids with quasiparticles have $G(\tau) \sim 1/\tau$)
- $T > 0$ Green's function has conformal invariance

**Schwarzian theory of quantum gravity
fluctuations also matches these corrections**
