A. Kitaev, unpublished; S. Sachdev, PRX **5**, 041025 (2015)

# The complex SYK model

There is a one-parameter family of critical solutions with varying  $e/U$ , yielding different  $0 < \mathcal{Q} < 1$ .

For long (imaginary) times  $\tau > 0$

$$\langle c_\alpha(\tau) c_\alpha^\dagger(0) \rangle = A e^{-2\pi \mathcal{E} T \tau} \times \left( \frac{T/U}{\sin(\pi T \tau)} \right)^{1/2}$$

In a Fermi liquid,

$$\langle c_i(\tau) c_i^\dagger(0) \rangle \sim \frac{T}{\sin(\pi T \tau)}$$

S. Sachdev and J. Ye,  
PRL **70**, 3339 (1993)

A. Georges and O. Parcollet  
PRB **59**, 5341 (1999)

# The complex SYK model

There is a one-parameter family of critical solutions with varying  $e/U$ , yielding different  $0 < \mathcal{Q} < 1$ .

For long (imaginary) times  $\tau > 0$

$$\langle c_\alpha(\tau) c_\alpha^\dagger(0) \rangle = A e^{-2\pi \mathcal{E} T \tau} \times \left( \frac{T/U}{\sin(\pi T \tau)} \right)^{1/2}$$

Determines the particle-hole asymmetry, and  $\mathcal{E} = \mathbb{C}e/U$ , with  $\mathbb{C} = 0.41$  from a numerical solution.

In a Fermi liquid,

$$\langle c_i(\tau) c_i^\dagger(0) \rangle \sim \frac{T}{\sin(\pi T \tau)}$$

S. Sachdev and J. Ye,  
PRL **70**, 3339 (1993)

A. Georges and O. Parcollet  
PRB **59**, 5341 (1999)

# Generalized SYK models

$$H = \frac{1}{(2N)^{3/2}} \sum_i \sum_{\alpha, \beta, \gamma, \delta=1}^N U_{i, \alpha \beta; \gamma \delta} c_{i\alpha}^\dagger c_{i\beta}^\dagger c_{i\gamma} c_{i\delta} - t \sum_{\langle ij \rangle} \sum_{\alpha} c_{i\alpha}^\dagger c_{j\alpha}$$

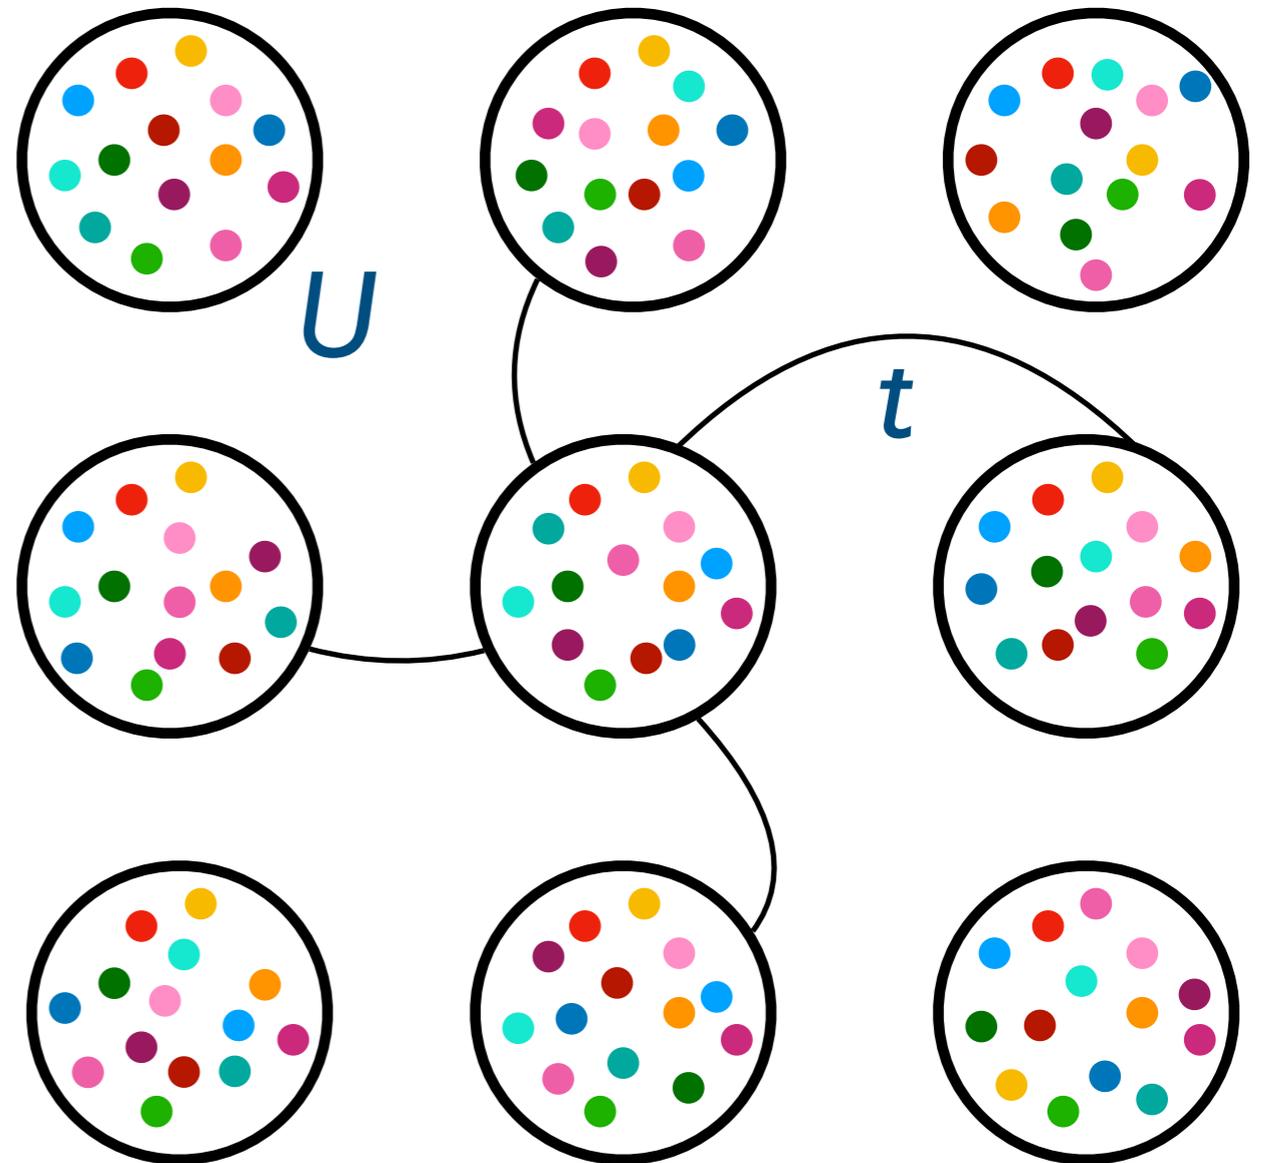

Choose  $U \gg t$  on-site,  
and independent between sites;  
yields ‘incoherent metal’  
with no Fermi surface  
for  $t^2/U \ll k_B T \ll U$  with

$$G(\mathbf{k}, \omega) = G_{\text{SYK}}(e, \hbar\omega/(k_B T))$$

independent of  $\mathbf{k}$ .

There is linear-in- $T$  resistivity  
but only with bad metal  
behavior with  $\rho > h/e^2$ , and  
co-efficient dependent upon  $U$ :

$$\rho \sim \frac{h}{e^2} \frac{k_B T}{t^2/U}$$

# Generalized SYK models

$$H = \frac{1}{(2N)^{3/2}} \sum_{k_a} \sum_{\alpha, \beta, \gamma, \delta=1}^N U_{\alpha\beta; \gamma\delta}(k_a) c_{k_1\alpha}^\dagger c_{k_2\beta}^\dagger c_{k_3\gamma} c_{k_4\delta}$$

Dispersive band.  
 $e_k$  defines  $m^*$   
and Fermi surface

$$+ \sum_{k\alpha} e_k c_{k\alpha}^\dagger c_{k\alpha}$$

$U_{\alpha\beta; \gamma\delta}(k_a)$  is a random function of  $\alpha\beta\gamma\delta$   
 $e_k$  has a bandwidth  $W$ .

# Generalized SYK models

$$H = \frac{1}{(2N)^{3/2}} \sum_{k_a} \sum_{\alpha, \beta, \gamma, \delta=1}^N U_{\alpha\beta; \gamma\delta}(k_a) c_{k_1 \alpha}^\dagger c_{k_2 \beta}^\dagger c_{k_3 \gamma} c_{k_4 \delta}$$

Dispersive band.  
 $e_k$  defines  $m^*$   
 and Fermi surface

$$+ \sum_{k\alpha} e_k c_{k\alpha}^\dagger c_{k\alpha}$$

Random interactions  
 uncorrelated  
 in space

$U_{\alpha\beta; \gamma\delta}(k_a)$  is a random function of  $\alpha\beta\gamma\delta$   
 $e_k$  has a bandwidth  $W$ .

$$\overline{U(k_1, k_2, k_3, k_4) U^*(k_5, k_6, k_7, k_8)} = U^2 \left[ \delta(k_1 + k_2 - k_3 - k_4 - k_5 - k_6 + k_7 + k_8) \right]$$

# Generalized SYK models

$$H = \frac{1}{(2N)^{3/2}} \sum_{k_a} \sum_{\alpha, \beta, \gamma, \delta=1}^N U_{\alpha\beta;\gamma\delta}(k_a) c_{k_1\alpha}^\dagger c_{k_2\beta}^\dagger c_{k_3\gamma} c_{k_4\delta}$$

Dispersive band.  
 $e_k$  defines  $m^*$   
 and Fermi surface

$$+ \sum_{k\alpha} e_k c_{k\alpha}^\dagger c_{k\alpha}$$

Random interactions  
 with  
 spatial correlations

$U_{\alpha\beta;\gamma\delta}(k_a)$  is a random function of  $\alpha\beta\gamma\delta$   
 $e_k$  has a bandwidth  $W$ .

We examine a model with weaker  $W \lesssim U$ , but impose a **resonance condition**.

This leads to a solution which obeys the Planckian ansatz as  $T \rightarrow 0$ .

$$\overline{U(k_1, k_2, k_3, k_4) U^*(k_5, k_6, k_7, k_8)} =$$

A.A. Patel and S. Sachdev, PRL **123**, 066601 (2019)

$$U^2 \left[ \delta(k_1 + k_2 - k_3 - k_4 - k_5 - k_6 + k_7 + k_8) \right]$$

$$\times \left[ \delta(e_{k_1} + e_{k_2} - e_{k_3} - e_{k_4}) + \delta(e_{k_5} + e_{k_6} - e_{k_7} - e_{k_8}) \right]$$

## Green's function of a Planckian metal

Has a 'remnant' Fermi surface at  $e_k = 0$ , where the spectral function is particle-hole symmetric.

$$G(\mathbf{k}, \omega) = G_{\text{SYK}} \left( \frac{e_k}{U}, \frac{\hbar\omega}{k_B T} \right)$$

$$G(\mathbf{k}, \tau) \sim e^{-(e_k/U)2\pi C T \tau} \times \left( \frac{T/U}{\sin(\pi T \tau)} \right)^{1/2}$$

## Green's function of a Planckian metal

Has a 'remnant' Fermi surface at  $e_k = 0$ , where the spectral function is particle-hole symmetric.

$$G(\mathbf{k}, \omega) = G_{\text{SYK}} \left( \frac{e_k}{U}, \frac{\hbar\omega}{k_B T} \right)$$

$$G(\mathbf{k}, \tau) \sim e^{-(e_k/U)2\pi\mathbb{C}T\tau} \times \left( \frac{T/U}{\sin(\pi T\tau)} \right)^{1/2}$$

Resistivity of a Planckian metal as  $T \rightarrow 0$

$$\rho = \frac{m^*}{ne^2} 2.71\mathbb{C} \frac{k_B T}{\hbar}$$

Note that all explicit dependence on  $U$  has cancelled out!

Choosing  $\mathbb{C} = 0.41$  as in the SYK model, we have the prefactor  $2.71\mathbb{C} = 1.11$ .

# Generalized SYK models

- Spin correlations have the ‘marginal’ form:  $\langle \vec{S}(\tau) \cdot \vec{S}(0) \rangle \sim 1/|\tau|$ .
- No pseudogap phase.
- Resonance condition should have its origin in  $T = 0$  quantum criticality.
- No ‘Mottness’: on-site Hubbard  $U$  is missing.

# t-J model

$$H = -\frac{1}{\sqrt{N}} \sum_{i,j=1}^N t_{ij} c_{i\alpha}^\dagger c_{j\alpha} + \frac{1}{\sqrt{N}} \sum_{i<j=1}^N J_{ij} \vec{S}_i \cdot \vec{S}_j$$

Each site has 3 states which we map to the ‘superspin’ space of a boson  $b$  (the holon) and a fermion  $f_\alpha$  (the spinon):

		
$b^\dagger  v\rangle$	$f_\uparrow^\dagger  v\rangle$	$f_\downarrow^\dagger  v\rangle$

$$c_\alpha = f_\alpha b^\dagger$$
$$\vec{S} = \frac{1}{2} f_\alpha^\dagger \sigma_{\alpha\beta} f_\beta$$

$$f_\alpha^\dagger f_\alpha + b^\dagger b = 1$$

$$\text{U(1) gauge invariance,} \quad b \rightarrow b e^{i\phi}, \quad f_\alpha \rightarrow f_\alpha e^{i\phi}$$

The physical electron ( $c_\alpha$ ) and spin ( $\vec{S}$ ) operators are rotations in this SU(1|2) superspin space.

# t-J model

$$H = -\frac{1}{\sqrt{N}} \sum_{i,j=1}^N t_{ij} c_{i\alpha}^\dagger c_{j\alpha} + \frac{1}{\sqrt{N}} \sum_{i<j=1}^N J_{ij} \vec{S}_i \cdot \vec{S}_j$$

Each site has 3 states which we map to the ‘superspin’ space of a boson  $b$  (the holon) and a fermion  $f_\alpha$  (the spinon):

$$\begin{array}{ccc} \text{—} & \text{—}\uparrow & \text{—}\downarrow \\ f^\dagger |v\rangle & b_\uparrow^\dagger |v\rangle & b_\downarrow^\dagger |v\rangle \end{array}$$

$$\begin{aligned} c_\alpha &= b_\alpha f^\dagger \\ \vec{S} &= \frac{1}{2} b_\alpha^\dagger \sigma_{\alpha\beta} b_\beta \end{aligned}$$

$$b_\alpha^\dagger b_\alpha + f^\dagger f = 1$$

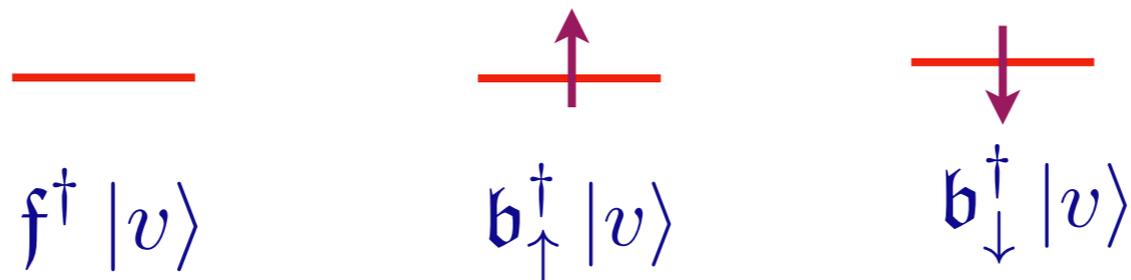

$$\text{U(1) gauge invariance,} \quad f \rightarrow f e^{i\phi}, \quad b_\alpha \rightarrow b_\alpha e^{i\phi}$$

The physical electron ( $c_\alpha$ ) and spin ( $\vec{S}$ ) operators are rotations in this SU(2|1) superspin space.

# t-J model

$$H = -\frac{1}{\sqrt{N}} \sum_{i,j=1}^N t_{ij} c_{i\alpha}^\dagger c_{j\alpha} + \frac{1}{\sqrt{N}} \sum_{i<j=1}^N J_{ij} \vec{S}_i \cdot \vec{S}_j$$

Each site has 3 states which we map to the ‘superspin’ space of a boson  $b$  (the holon) and a fermion  $f_\alpha$  (the spinon):

$$c_\alpha = b_\alpha f^\dagger$$

$$\vec{S} = \frac{1}{2} b_\alpha^\dagger \sigma_{\alpha\beta} b_\beta$$

$$\text{SU}(1|2) \equiv \text{SU}(2|1)$$

$$b_\alpha^\dagger b_\alpha + f^\dagger f = 1$$

U(1) gauge invariance,  $f \rightarrow f e^{i\phi}, \quad b_\alpha \rightarrow b_\alpha e^{i\phi}$

The physical electron ( $c_\alpha$ ) and spin ( $\vec{S}$ ) operators are rotations in this SU(2|1) superspin space.

# Insulating $J$ model

$$H = \frac{1}{\sqrt{N}} \sum_{i < j=1}^N J_{ij} \vec{S}_i \cdot \vec{S}_j$$

$$\alpha = \uparrow, \downarrow, \quad \vec{S}_i = \frac{1}{2} c_{i\alpha}^\dagger \vec{\sigma}_{\alpha\beta} c_{i\beta}, \quad \sum_{\alpha} c_{i\alpha}^\dagger c_{i\alpha} = 1$$

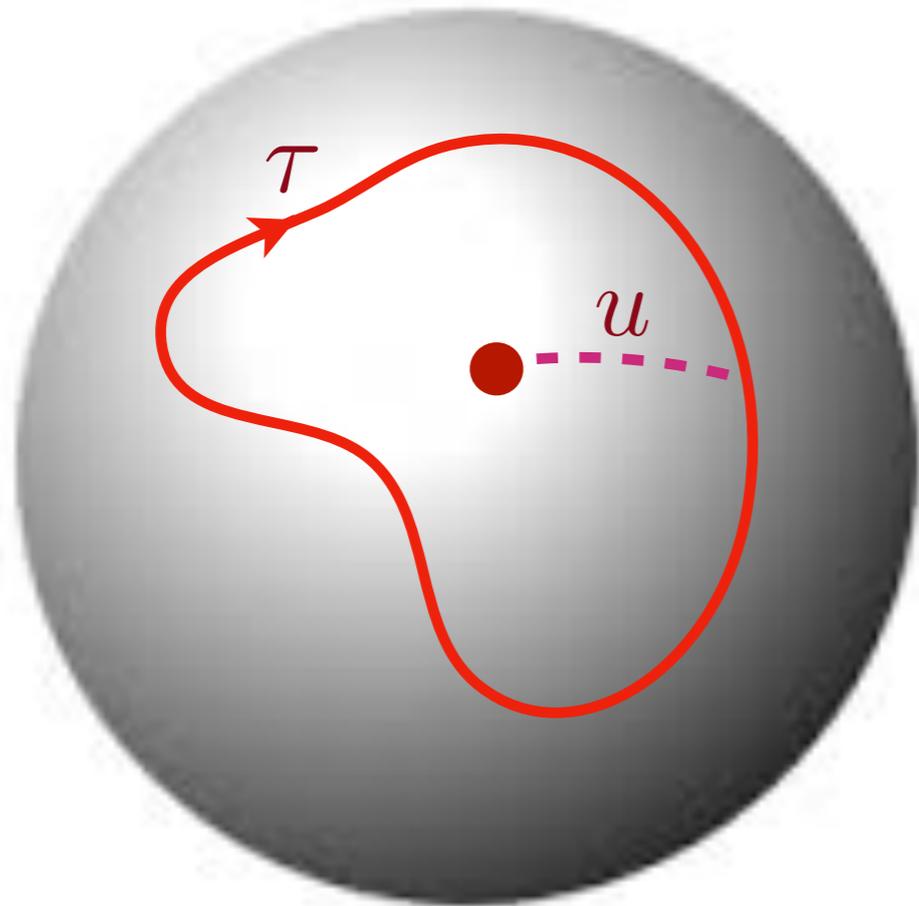

$$J_{ij} \text{ random, } \overline{J_{ij}} = 0, \overline{J_{ij}^2} = J^2$$

# Insulating $J$ model

$$\mathcal{Z} = \int \mathcal{D}\vec{S}(\tau) \delta(\vec{S}^2 - 1) e^{-\mathcal{S}_B - \mathcal{S}_J}$$

$$\mathcal{S}_B = \frac{i}{2} \int_0^1 du \int d\tau \vec{S} \cdot \left( \frac{\partial \vec{S}}{\partial \tau} \times \frac{\partial \vec{S}}{\partial u} \right)$$

$$\mathcal{S}_J = -\frac{J^2}{2} \int d\tau d\tau' Q(\tau - \tau') \vec{S}(\tau) \cdot \vec{S}(\tau').$$

# Insulating $J$ model

$$\mathcal{Z} = \int \mathcal{D}\vec{S}(\tau) \delta(\vec{S}^2 - 1) e^{-\mathcal{S}_B - \mathcal{S}_J}$$

$$\mathcal{S}_B = \frac{i}{2} \int_0^1 du \int d\tau \vec{S} \cdot \left( \frac{\partial \vec{S}}{\partial \tau} \times \frac{\partial \vec{S}}{\partial u} \right)$$

$$\mathcal{S}_J = -\frac{J^2}{2} \int d\tau d\tau' Q(\tau - \tau') \vec{S}(\tau) \cdot \vec{S}(\tau').$$

From this action we compute

$$\overline{Q}(\tau - \tau') = \frac{1}{3} \left\langle \vec{S}(\tau) \cdot \vec{S}(\tau') \right\rangle_{\mathcal{Z}}$$

and then impose the self-consistency condition

$$Q(\tau) = \overline{Q}(\tau).$$

## t-J model

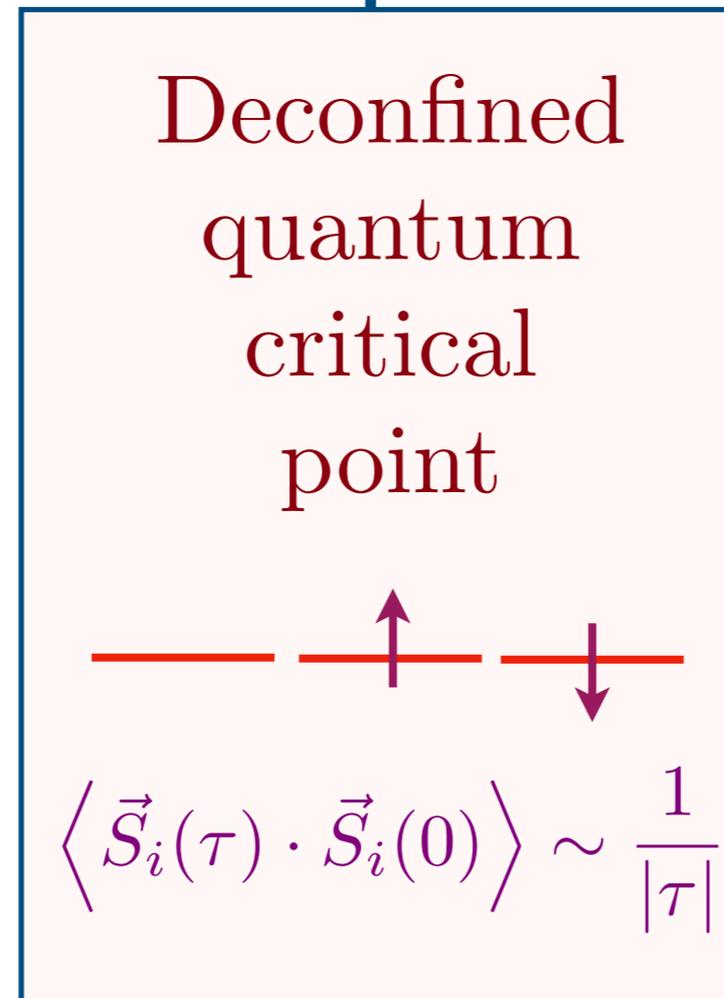

$$\mathcal{Z} = \int \mathcal{D}\mathcal{P}(\tau) e^{-\mathcal{S}_B - \mathcal{S}_{tJ}}$$

$$\mathcal{S}_B = i \int_0^1 du \int d\tau \text{Tr} (\mathcal{P} \partial_\tau \mathcal{P} \partial_u \mathcal{P})$$

$$\begin{aligned} \mathcal{S}_{tJ} = & \int d\tau d\tau' \text{Tr} (\mathcal{P}(\tau) \mathcal{Q}(\tau - \tau') \mathcal{P}(\tau')) \\ & + \int d\tau \text{Tr} (s_0 \mathcal{P}(\tau)) . \end{aligned}$$

Path integral over a superspin  $\mathcal{P}(\tau)$  with a self-consistent self-interaction  $\mathcal{Q}(\tau)$  and a ‘Zeeman superfield’  $s_0$ .

**Quasi-static magnetism in the pseudogap state of  $\text{La}_{2-x}\text{Sr}_x\text{CuO}_4$ .** Temperature – doping phase diagram representing  $T_{\min}$ , the temperature of the minimum in the sound velocity, at different fields. Since superconductivity precludes the observation of  $T_{\min}$  in zero-field, the dashed line (brown area) represents the extrapolated  $T_{\min}(B=0)$ . While not exactly equal to the freezing temperature  $T_f$  (see Fig. 2),  $T_{\min}$  is closely tied to  $T_f$  and so is expected to have the same doping dependence, including a peak around  $p = 0.12$  in zero/low fields (ref. 2). Onset temperatures of charge order are from ref. 33 (squares) and 35 (hexagons).

Metallic spin glass.

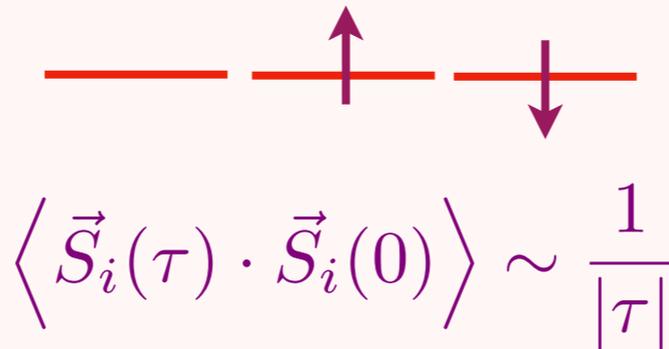

Condense spinon  $\mathbf{b}_\alpha$ ,  
 $f$  carrier density  $p$

$f^\dagger |v\rangle$

$$\langle \vec{S}_i(\tau) \cdot \vec{S}_i(0) \rangle \sim \text{constant}$$

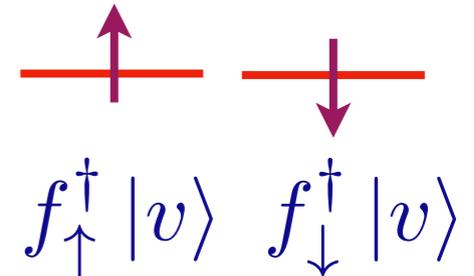

Deconfined quantum critical point

SU(1|2) theory

Disordered Fermi liquid.

Condense holon  $b$ ,  
 $f_\alpha$  carrier density  $1 + p$

$b^\dagger |v\rangle$

$$\langle \vec{S}_i(\tau) \cdot \vec{S}_i(0) \rangle \sim \frac{1}{\tau^2}$$

Zeroth order,  $p_c = 1/3$

$p_c$

$p$

- $t$ - $J$  models with random and all-to-all interactions exhibit a deconfined critical point at a non-zero doping  $p = p_c$ , flanked by conventional confining phases with carrier densities  $p$  and  $1 + p$ .

- *t*-*J* models with random and all-to-all interactions exhibit a deconfined critical point at a non-zero doping  $p = p_c$ , flanked by conventional confining phases with carrier densities  $p$  and  $1 + p$ .
- Underlying reason for quantum criticality: statistical transmutation from bosonic to fermionic spins. Degeneracy of 3 states of *t*-*J* model yields zeroth order prediction,  $p_c = 1/3$ .

- $t$ - $J$  models with random and all-to-all interactions exhibit a **deconfined critical point** at a non-zero doping  $p = p_c$ , flanked by conventional confining phases with carrier densities  $p$  and  $1 + p$ .
- **Underlying reason for quantum criticality:** statistical transmutation from bosonic to fermionic spins. Degeneracy of 3 states of  $t$ - $J$  model yields zeroth order prediction,  $p_c = 1/3$ .
- Closely related saddle-point equations were obtained in an “extended dynamical mean-field theory (EDMFT)” of **non-random** lattice  $t$ - $J$  models.

- $t$ - $J$  models with random and all-to-all interactions exhibit a **deconfined critical point** at a non-zero doping  $p = p_c$ , flanked by conventional confining phases with carrier densities  $p$  and  $1 + p$ .
- **Underlying reason for quantum criticality:** statistical transmutation from bosonic to fermionic spins. Degeneracy of 3 states of  $t$ - $J$  model yields zeroth order prediction,  $p_c = 1/3$ .
- Closely related saddle-point equations were obtained in an “extended dynamical mean-field theory (EDMFT)” of **non-random** lattice  $t$ - $J$  models.
- The structure of the DQCP is similar to the SYK models: both have local **spin correlations which decay as  $\sim 1/|\tau|$**  in imaginary time  $\tau$ .

# Random $t$ - $J$ - $U$ model

$$H = -\frac{1}{\sqrt{N}} \sum_{i,j=1}^N t_{ij} c_{i\alpha}^\dagger c_{j\alpha} + \frac{1}{\sqrt{N}} \sum_{i<j=1}^N J_{ij} \vec{S}_i \cdot \vec{S}_j + U \sum_{i=1}^N n_{i\uparrow} n_{i\downarrow}$$

$$\alpha = \uparrow, \downarrow, \quad \vec{S}_i = \frac{1}{2} c_{i\alpha}^\dagger \vec{\sigma}_{\alpha\beta} c_{i\beta}, \quad n_{i\alpha} = c_{i\alpha}^\dagger c_{i\alpha},$$
$$t_{ij}, J_{ij} \text{ random}, \quad U > 0$$
